

ALIBI MEMORY

PRODUCT NUMBER 2564

Features

Directive 90/384/EEC stipulates that equipment which repeats approved measurements and that does not affect the proper functioning of the weighing machine (e.g. warehouse management systems, delivery note printers, etc.) are exempt from the approval obligation, provided the measurements are saved correctly in the approved system in such a way that they cannot be changed and that these values are accessible to the parties affected by the measurement.

The usual way to save these measurements so far is by an alibi printer or an alibi memory integrated in the data line.

Soehnle Professional has now developed a software module that produces an approvable data memory for weighing or dimension measurements in combination with a computer. This means that no additional hardware is needed. The software runs without any additional approval requirements such as lead sealing, etc. on any commercially available PC bearing the CE sign and running on the Microsoft Windows (32-bit) operating system. A PTB (German Physical-Technical Institute) test certificate is provided with the software.

All approved electromechanical scales with EC type approval, including automatic scales, are connectable to the RS 232 serial port. Each data record saved includes the date and time, the ID index and a weighing or dimension measurement. Measurements are archived using the user-friendly Windows user interface and permits easy access (Search, Select, Print) to stored data.

The software also allows several alibi memories to operate simultaneously on one computer. Additional software, e.g. non-approved application programs to process measurements, may be loaded on the PC and used without restriction.

The approvable data memory from Soehnle Professional is a viable alternative on PC and offers many significant advantages compared with previous alibi printers or external alibi memories:

- > No additional hardware
- > No additional power supply
- > No additional space requirement
- > No annoying copying or exporting to PC or evaluation of print rolls
- > Much reduced failure risk
- > Price advantage compared to all other systems
